

The graph displays the mortality rate in the United States over a century. The x-axis represents the year, and the y-axis represents the number of deaths per 100,000 people. The rate starts at approximately 20 in 1900, drops to a low of about 10 in 1913, then rises sharply to a peak of nearly 30 in 1918-1919. Following this, the rate generally declines with some fluctuations, reaching a low of about 5 in 1968-1969, and then rises sharply to about 25 in 1970. The rate continues to fluctuate between 15 and 25 until 2019, where it is approximately 18.
